UNIQUE APPROACH TO THE DESIGN OF A CURVED ARTIFICIAL COMPOUND EYE CONSISTING OF MOSAIC TINY OPTICAL UNITS

PARIS - LAUSANNE, 14.08.2015, 16:16 Time

USPA NEWS - Insect compound eyes consist of a mosaic of tiny units. Compared with vertebrate single-lens eyes, compound eyes offer a versatile morphology with panoramic field of view, negligible distortion and aberration, and high temporal resolution, while trading high spatial resolution for diminutive size.

According to the publication of the Laboratory of Intelligent Systems, Ecole Polytechnique Fédérale de Lausanne, such curved visual sensors may be useful for terrestrial and aerial vehicles, medical instruments, prosthetic devices, home automation, surveillance, motion capture systems, and smart clothing.

In most animal species, vision is mediated by compound eyes, which offer lower resolution than vertebrate single-lens eyes, but significantly larger fields of view with negligible distortion and spherical aberration, as well as high temporal resolution in a tiny package.

This design method opens up additional vistas for a broad range of applications in which wide field motion detection is a premium, such as collision-free navigation of terrestrial and aerospace vehicles, and for the experimental testing of insect vision theories.

The features are particularly beneficial for visually controlled navigation, including tasks like collision avoidance, take-off, landing, and other optomotor responses that do not require a high density of photoreceptors.
